

Dan Silveira, MDes
Senior Product Design Consultant @ IBM | Writer & Professor

What is good design? This is a question I often return to because what surrounds design interests me as much as design itself. Good design arrives at the intersection of a designer’s creativity, their fluency with methods that reveal the user’s point of view, and their instinct for strategy. It’s what lets a designer reconcile what the business wants with what the user needs and what the system allows into one solution that serves all three.

How I see design

These four lenses shape my approach to design as a discipline.

Strategic Foresight

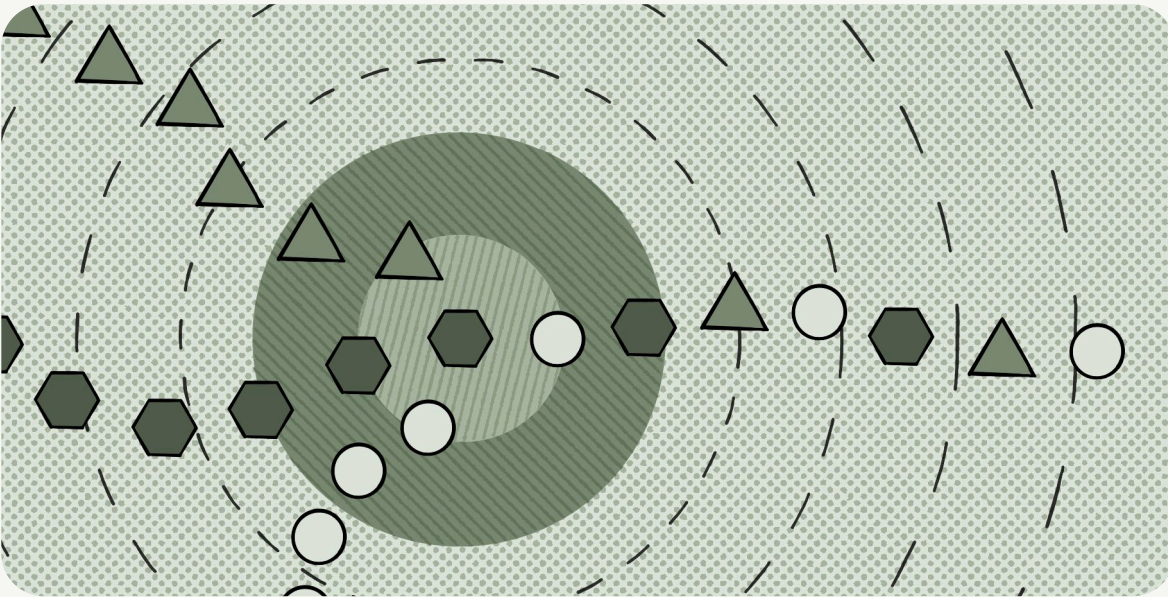

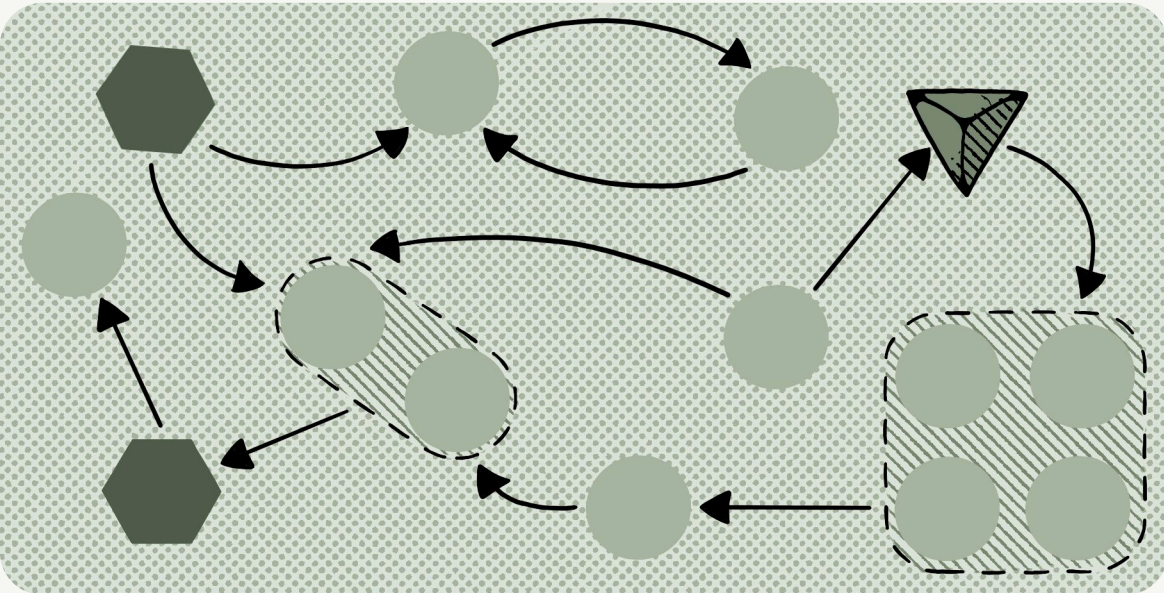

Strategic foresight isn't prediction. It's asking what the thing we build today will need to become once the world around it has moved.

Products shift. Environments shift. Even personas expire. Methods that model and monitor those shifts give a team something to design toward, rather than a present to optimize for, or a competitor to match.

System Thinking

Every product we design is a moment within a larger tapestry of experiences and user decisions.

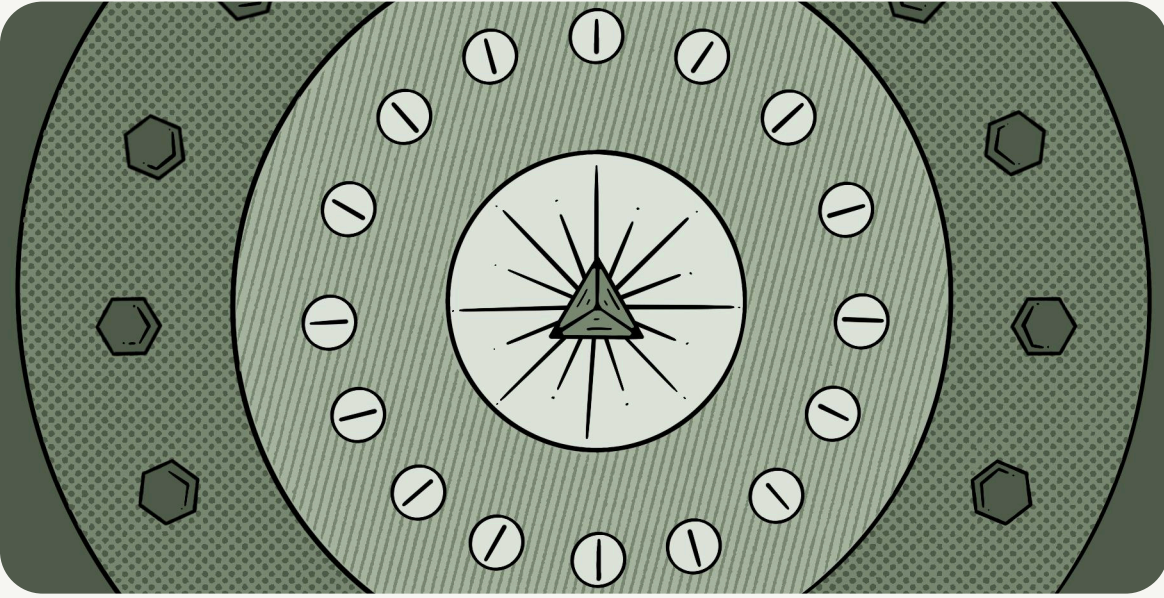

By mapping these systems as both networks of interconnected nodes and as layered structures of front-stage, back-stage, and supporting services, we can understand how a design choice ripples across the wider experience, and design with the whole picture in view.

Human-Centered Design

Human-centered design is not a mantra; it’s an approach to realize the potential of a product by building experiences that go beyond what users could envision for themselves.

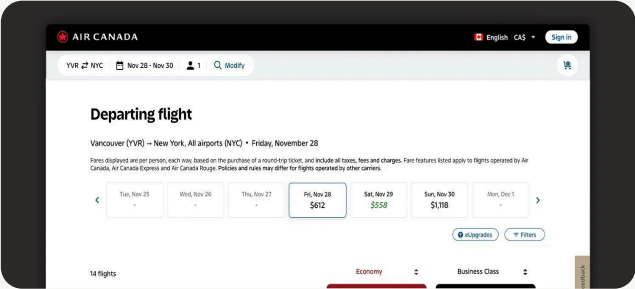

Through dedicated research and stakeholder collaboration, we are able to develop a shared understanding that transitions ideas into practice.

Trends Report 2026

Read the latest trends report I researched and wrote using strategic foresight methods and frameworks.

The Design-Knowledge Framework

An investigation of the limits of AI generation in Design and the effects of prompt priming. This article explores the different thinking processes of AI and Design, and how, by using a design-knowledge framework, we can guide AI into creating more human-centred designs.

The Fog of Now

Explore how organizations become so fixated on present-day customer needs and agile sprint cycles that they lose sight of emerging futures. This article argues for layering strategic foresight methodologies onto agile practices, enabling teams to develop future-oriented visions guided by emerging trends rather than optimizing solely for the present.
